Emote Set

The Emotes/ folder contains three types of assets that can be used together.

Complete Emote Bubbles

UI_EmoteBubble_EX_*

Ready-to-use speech bubbles with symbols already placed inside them.

Standalone Emote Icons

UI_Icon_*

Includes:

- Anger
- Ellipsis
- Exclamation
- Heart
- Question
- Question + Exclamation
- Quill

These icons can be used on their own or combined with the empty speech bubbles.

Empty Speech Bubbles

UI_SpeechBubble_*

Includes:

- Burst
- Default
- Thought

You can place your own icon, symbol, or text inside them to create custom emotes.

Dialogue Choice Button States

The UI_Dialogue_ChoiceButton series includes four matching states:

- Normal
- Hover
- Selected
- Disabled

All four sprites use the same dimensions, so no position or size adjustment is required when switching between states.

Usage Guidelines

The following recommendations apply regardless of which engine you use.

Use Nearest / Point Filtering

Set texture filtering to **Nearest** or **Point**.

Using Bilinear or Linear filtering will blur the pixel edges and make the artwork appear soft.

This is one of the most common issues when importing pixel-art assets.

Disable Texture Compression

We recommend disabling texture compression for the UI sprites.

Compression can create artifacts around sharp color boundaries, and because the original sprites are relatively small, the storage savings are usually minimal.

Scale by Integer Multiples

For the sharpest results, scale pixel-art assets using integer multiples whenever possible.

Recommended:

```
1x  
2x  
3x  
4x
```

Avoid fractional scaling such as:

```
1.5x  
2.5x
```

Fractional scaling can cause uneven pixel widths and inconsistent edges.

9-Slice Panels and Buttons

Panels and buttons that need to be resized are designed to work with **9-slice scaling**.

Depending on your engine, this feature may be called:

```
9-Slice  
Nine Patch
```

Sliced
Scale 9 Grid

9-slicing preserves corners and decorative borders while stretching only the center and edge regions.

This allows dialogue boxes, message panels, and buttons to be resized to fit different amounts of text without distorting their borders.

Icons, emotes, and decorative elements are intended for fixed-size use and generally do not require 9-slicing.

Font

The `Font/` folder includes **NeoDunggeunmo Pro**, the font used in the preview images.
